What Big Data Is Not... at Least Not Yet!

Faced by the spin and hype surrounding big data, a key for managers and executives wishing to execute a successful big data strategy is to sift the possible future realities from the possible future fictions.

Interest over time. Web Search. Worldwide, 2004 - present.

View full report in Google Trends

The CIO's conundrum

A worthwhile and natural starting point for examining big data hype is Gartner's 2012 Hype Cycle. This indicates the distance a technology is from becoming a common productivity tool. Gartner has depicted three tools it judges as being 10 years away from the plateau: Information valuation; the Internet of Things; and the semantic web.

Information Valuation evaluated

First, Information Valuation is great in concept but currently extremely hard in reality to execute. The ability to value individual pieces of information accurately without a free market is challenging. It took the advent of marketplaces such as eBay to enable people to value the items in their basement and see that they were someone else's treasure.

Time to examine the noise around big data

However, markets in the intellectual capital space have developed and are now about ten years old, and as such Gartner's predictions for information valuation are perhaps on track. This knowledge thus

allows executives and managers to accommodate the valuation of their data into their long-term planning cycle and thus avoid the disappointment of the short-term reality not living up to the hype.

The Internet of Things on the horizon

Second, the Internet of Things, a term born in 1999 and attributed to Kevin Aston, refers to tagging every object in the world with an IP addressable tag. Again, in theory this is possible as IPv6 allows 2128 objects to be tagged. Eventually this will likely happen, as IP addressable QR codes or tags can be applied to objects and tracked given enough resources. However, we are not there yet, and there are many hurdles, both technical and regulatory, to overcome before this is a reality. For example, if a retailer sells a customer a bottle of water with an identifiable code, and that empty bottle is thrown away and not recycled, it would be possible to trace that back to the individual and for a government agency to fine that individual. In such situations, data, its ownership and its oversight, will need qualifying by society as a whole. Otherwise, perhaps big data will become associated with Big Brother, rather than big business value.

The tangled Semantic Web

Thirdly, the Semantic Web, a common framework helping data to be more easily shared and reused, has been discussed in knowledge representation circles since the 1960s, with recent efforts, from 2001, led by Sir Tim Berners-Lee and W3C.org. However, while the theoretical base of a true semantic web is evolving slowly, there has been progress towards a standard for a Semantic Web Stack encompassing URI, UNICODE, XML, RDF, SPARQL, RDFS, and OWL development including terms of rule validity through RIF/SWRL. Even with this progress, critics point to its weaknesses such as the ability to manipulate the semantics around an object; the use by censors to limit or monitor informational content; and the increased loads on both humans and systems through the addition of a meta layer to the data. As such, in the near term, while big data is going to rely on XML and its associated technologies, it is not going to be utilizing a fully implemented version of the semantic web and its associated applications any time soon.

Overall, big data is here to stay -- it is going to become an increasingly central activity to all organizations wishing to remain competitive. However, executives need to be reminded that a key to embracing any new technology is to understand its limitations and not chase after some holy grail that may or may not exist; staying grounded in the art of the possible is a secure way of working towards maximizing the long-term ROI for any technology and delivering to the business on promises made.

Re: Big Data Maturity.
Part of what is fueling the Hype Cycle is the fear of being left behind even as companies accept they are wandering into the unknown. You are right that this was what created the dot bomb and this is what is driving the hype surrounding big data. However, the fear of being left behind is not without basis. Big data is real. Tapping it and efficiently using it are the areas of concern.

Re: Big Data Maturity.
We have seen big data proven itself to an extent ie certain projects. Gathering and retaining granulated data is excessive but there is value. Cost savings, powerful analytics can streamline projects and increase profit margins.

Re: Big Data Maturity.
Big data has now opportunity to identify new emerging data for organizations. Big Data is a substantial market. Most of our big data today has been produced in last two years alone.

Re: Big Data Maturity.
I really like this article. The Hype Cycle seen again and again, from dot bomb to social media and now big data. I guess experience tells us that some people will never learn, eh?

Funny thing is, if organizations would actually stop and really learn in a level-headed way about the latest big thing -- the Hype Cycle would never happen. All it takes is to do one's homework first.

Re: Big Data Maturity.
Yes, social media and retailers are leading but thats a symbiotic relationship.

Healthcare is lagging which in the US is probably to be expected, it lags in every ERP category, but the UK should lead after the long history of the NHS project and lessons learned.

As in every disruptive tech deployment laggards are waiting for cost reduction to occur and hope the risk of doing so will not be catastrophic.

Time will tell

Re: Big Data Maturity.
Industry AND geography @mharden. Telecoms big data is huge in Europe and Asia. It's easy to feel like retail are leading here... but it might just be their heightened visibility.

Re: Big Data Maturity.
Does big data maturity vary by industry? Are retailers and social networking companies considered the major drivers of big data's technology maturity with banks and healthcare companies trailing behind?

Small world (type-o!)
In noting that the Internet of Things envisions every object in the world having an IP tag you write:

"Again, in theory this is possible as IPv6 allows 2¹²⁸ objects to be tagged."

I'm pretty sure that should be 2¹²⁸ :)

Re: Big Data Maturity.
The Cloud is a sexy marketing term for ASP or Application Service Provider) put forth around 2000 which makes it 13 years old, if we go back to the old Service Bureau days of the 60's and 70's it is about 35 years old. BD is really an extension of VLDB so is about 30 years old, but now we have more powerful and cheaper technologies to drive the change. But I think the BD value path will largely be an IQ test for firms and is going to be more disruptive than they think.
